FLOW STATE

An AI-powered daily check-in that connects wellbeing, workload and planning

n8n • Google Calendar • OpenAI • Google Sheets • Gmail

AI for Good — Hackathon 2 | SDG 3: Good Health & Well-being

The problem

Busy days are planned around tasks — not around how someone is actually doing.

1. Fragmented information

How you feel, what is in your calendar and your previous days live in different places.

2. No early signal

People often notice overload only when they are already exhausted or behind.

3. Generic advice

A normal reminder does not know whether today is empty, packed, energetic or difficult.

Goal: turn a 1-minute check-in into useful, personalized guidance for the day.

Why SDG 3?

Good Health & Well-being — with a clear mental-health component

Mental well-being

Flow State asks users to reflect on mood, energy and mental load instead of focusing only on productivity.

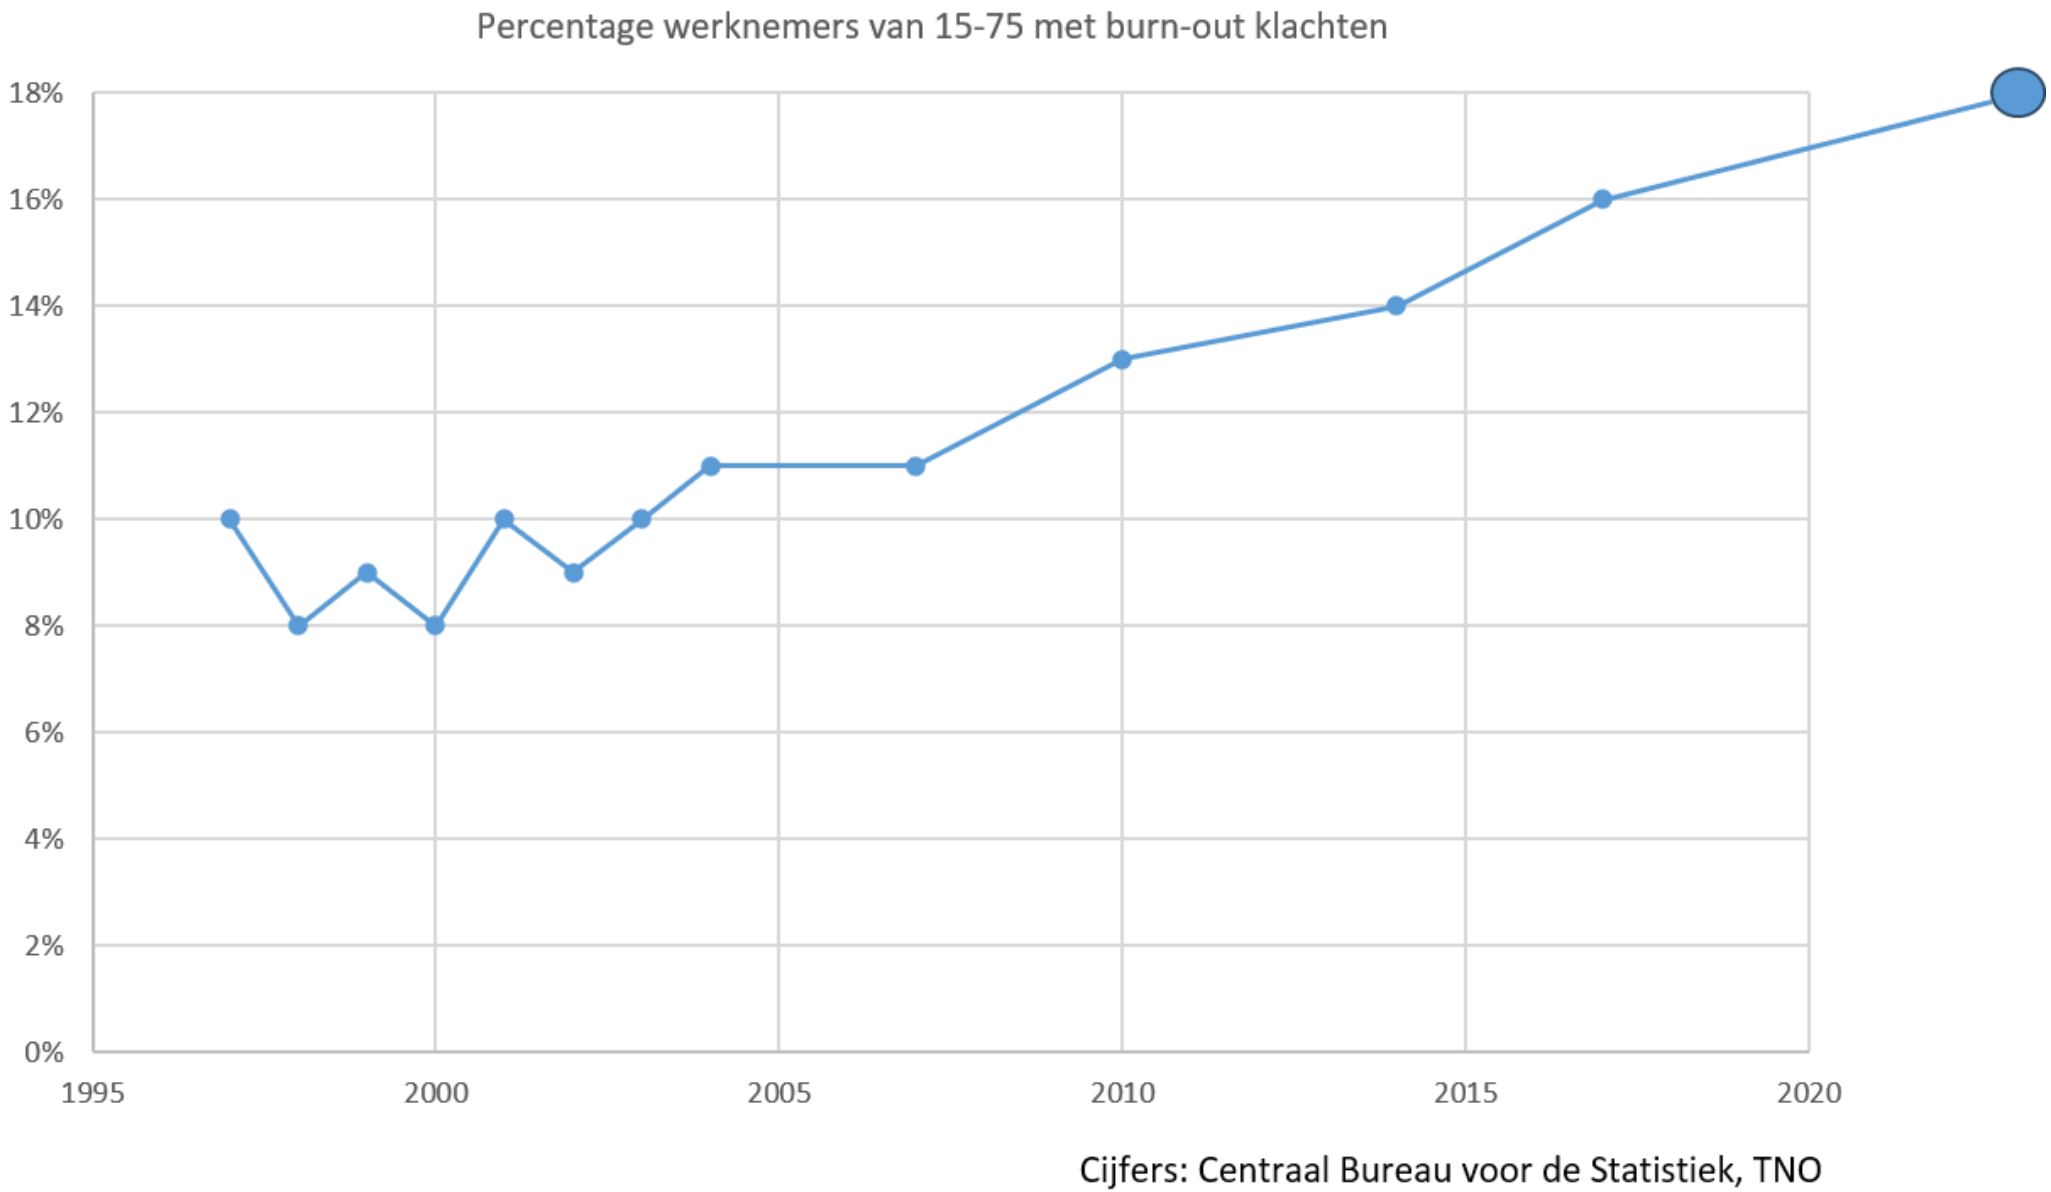

Early awareness

Combining a daily check-in with workload can help users notice when they may need to slow down, recover or seek support.

Practical support

The AI turns the check-in into simple suggestions for pacing, breaks and planning — without diagnosing the user.

Flow State supports self-reflection and healthier day planning; it is not a medical tool.

Cijfers: Centraal Bureau voor de Statistiek, TNO

The idea: Flow State

One simple daily flow, with as little manual work as possible.

1

Check in

Sleep, energy, mental load, mood + short note

2

Read calendar

Automatically checks today's scheduled hours

3

AI review

Combines today's input with recent historical data

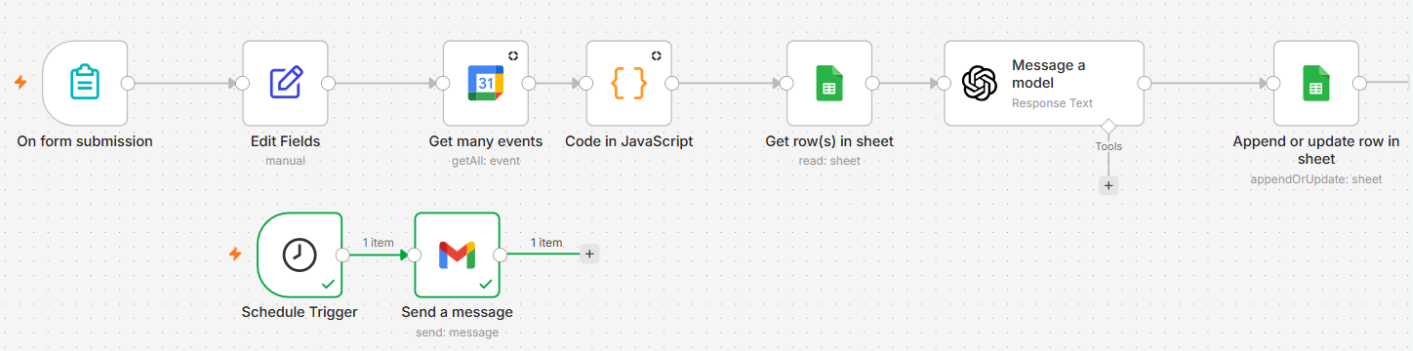

4

Save & remind

Updates DailyData and sends the daily reminder

What I built in n8n

The prototype is a working automation, not just a mock-up.

- Form submission starts the main workflow
- Google Calendar provides today's workload
- JavaScript prepares the calendar data
- OpenAI creates a personalized daily review
- Google Sheets stores the result and history
- A separate Schedule Trigger sends the reminder email

✓ 6+ nodes ✓ AI ✓ automatic triggers

Demo: submit the form → show AI review → show updated Google Sheet / reminder email

What the AI actually does

It uses context instead of producing a generic wellness message.

Today's input

Sleep • energy • mental load • mood • free-text note

Context

Calendar workload + previous DailyData entries

AI REVIEW

Output

1. Daily summary
2. What is going well
3. What to watch
4. Practical advice for today

Example output

The result is immediately understandable and actionable.

“You slept 7 hours and reported a good mood.
Your calendar is relatively open today, so you have flexibility. Because you still feel tired,
start with one small clear task, take an early restorative break and reassess your energy.”

Important: Flow State is a planning & self-reflection tool — not a medical diagnosis system.

Why this is useful

The value comes from connecting data that normally stays separate.

Low effort

One short form. The calendar lookup, analysis, storage and reminder are automated.

Personalized

Advice changes with both subjective input and objective workload.

Learns over time

DailyData creates a history that can later reveal patterns and support better planning.

Future step: a dashboard with weekly trends, overload signals and smarter reminders.

Ethical reflection

Health automation must have clear limits.

If it is wrong

AI can misread mood, sleep or workload and give unsuitable advice. Output should be framed as support, never as diagnosis.

If it is late or down

n8n, Gmail, Calendar or the AI service can fail. Flow State must never be relied on for urgent or safety-critical help.

Where AI stops

Persistent or serious mental-health concerns require human judgement and, where appropriate, professional support.

Privacy & trust

Sleep, mood, notes and calendar data are personal. Users should know what is accessed and retain control over their data.

Would we trust it? Yes as a self-reflection and planning assistant.
No as a replacement for a doctor, psychologist or emergency service.

FLOW STATE

From a 1-minute check-in
to a smarter plan for your day.
